87.5%

Grade

A

Feedback

The student's answer provides a strong foundational understanding of AI, correctly identifying it as a scientific branch that enables computers to mimic human intelligence and actions. However, it misses the important specificity of 'Computer Science' and includes a statement about AI's purpose rather than its core definition. To improve, focus on providing a concise definition of the field itself and its capabilities, distinguishing it from its applications or benefits.

Strengths

- ✓ Correctly identifies AI as a 'branch of science', indicating its academic/field nature.
- ✓ Accurately states that AI 'enables computers' to perform certain functions.

- ✓ Effectively captures the core idea of AI mimicking human cognitive abilities with the phrase 'think like human'.
- ✓ Includes 'and take actions', which aligns with the concept of performing tasks.

Areas for Improvement

- The answer lacks the specific field 'Computer Science', which provides crucial context.
- The phrase 'to decrease human effort' describes a purpose or benefit of AI, not a fundamental part of its definition as a field or its capabilities.
- Could be more precise by stating 'performing tasks that typically require human intelligence' rather than just 'think like human', as AI often simulates intelligence without necessarily 'thinking' in a human sense.
